

Exercise 2.5: Django MVT Revisited

1. In your own words, explain Django static files and how Django handles them.

Static Files are files that don't change and are 'static', such as CSS and images. Django handles these files by storing them in separate directories for organization. Once running Django will fetch whatever files are needed and consolidate them into one directory for efficiency and speed.

2. Look up the following two Django packages on Django's official documentation and/or other trusted sources. Write a brief description of each.

Package	Description
ListView	The ListView as the name implies, is a view that revolves around displaying and operating upon a list of multiple objects. Because you have this whole list it is ideal for filtering objects, or comparing those objects in the list against each other.
DetailView	The DetailView can be seen as the reverse of the ListView, where instead of viewing multiple objects you view a single object in detail. This view is very helpful for when you want to find or edit a specific object.

- 3. You're now more than halfway through Achievement 2! Take a moment to reflect on your learning in the course so far. How is it going? What's something you're proud of so far? Is there something you're struggling with? What do you need more practice with? You can use these notes to guide your next mentor call.**

So far this achievement has been a lot more straightforward than the last one. Things started ramping up a lot in this exercise though, so I'm interested to see what things I learn next. As I have progressed further and further in this course I have found myself becoming increasingly comfortable with the terminal which is a great feeling. That is something I will be interacting with a lot in my future so getting used to it now is a solid step forward.
