

Model/Table changes

- Added picture attribute
- Added difficulty calculation
- Added corresponding pictures for each recipe

Frontend Inspirations

The only recipe app I've ever used was Mixel, which is a recipe app that specializes in mixed drinks. The entire aesthetic of the app is like a pixelated video game which I really enjoyed, and gave the app a lot of charm. That being said, I don't think it would be an appropriate style for my own app. Having to find/make a pixelated picture for every single recipe would be a lot of work and likely would result in pretty inconsistent quality picture to picture. Furthermore because the pictures are pixelated it can be hard for someone to figure out exactly what the recipe is if they've never seen it before. Those negatives aside, the individual recipe pages are very clean and the layout gets all the information you need across incredibly well, so I will likely do a similar setup for my own app.
